

Research in live animals is still essential for basic research and the pharmaceutical industry for the discovery, development and production of new pharmaceuticals.

At SCANBUR we believe that all experimental animals should be housed in an environment that supports good animal welfare while allowing to perform good research.

We supply research animals, equipment, bedding, enrichment and diet to animal research facilities and by combining our technical knowledge in equipment development with a biological knowledge we succeed in providing solutions that fulfill the requirements of specific research animals.

We comply with EU and national regulations (DIRECTIVE 2010/63/EU) on housing of research animals and take pride on providing solutions that are best in class, also when it comes to implementing the 3Rs principles (replacement, reduction and refinement). We also comply with specific national regulations and we are committed to go beyond just meeting the regulatory requirements as we seek to implement best practice.

This provides a basis for researchers to do high quality animal research and advancing animal welfare. We are committed to go beyond just meeting the regulatory requirements and we seek to implement best practice.

Our partners supplying research animals, bedding, enrichment, diet and some of our equipment are world leading companies within their fields of expertise. SCANBUR and partners have a good collaboration, that do not only seek to maintain a high animal welfare, but continuously we strive to increase and optimize the welfare for animal in science. All our partners have high standards in this field, and all comply with EU regulations.

SCANBUR has an animal welfare body, a forum where we can discuss and solve any animal welfare issues that might occur and handle them in a proper and timely manner.
