

GREEN FOOTPRINT CONTRIBUTION

SCANCLIME CONSIDERABLY REDUCES CO₂ EMISSION

ScanClime replaces humidification at room level and contributes to a significant reduction of your CO₂ footprint.

In a 600 m² animal room with 4000 cages, a ScanClime introduction will mean a reduction in CO₂ emission with up to 300 tons/year - this equals what 30 average households emit in one year!

ScanClime is an air handling unit developed to control the relative humidity very accurately at cage level in IVC's and Scantainers in line with the legal requirement of 45-65%.

By changing the concept of air handling and humidification directly to cage level, you actively choose to contribute to a greener, better future. Get in touch and let's talk!
